- In mathematics, the Laplace transform, named after its inventor **Pierre-Simon Laplace**, is an integral transform that converts a function of a real variable t (often time) to a function of a complex variable s (complex frequency).
- The concept of Laplace transform plays a vital role in wide field of science and technology like, electric and communication engineering, quantum physics, and many others.
- Specially, it is used as a tool for solving linear differential equations arising in engineering.
- In particular, it transforms ordinary linear differential equations into algebraic equations, whose solution can be once again transformed/inverted to obtain the solution of the original problem.

Laplace Transform

Mathematical
Methods(MA-

Mukhopadhyay

Laplace
Transform

Properties of
Laplace
transform

Laplace
transform of
 $\{tF(t)\}$ and
 $\left\{\frac{F(t)}{t}\right\}$

Laplace
transform of
 $\operatorname{erf}(\sqrt{t})$

Examples

Exercise

Definition:

The **Laplace transform** of a given function $F(t)$ defined for all real $t \geq 0$ is a function of a new variable s given by

$$L\{F(t)\} = f(s) = \int_0^{\infty} e^{-st} F(t) dt \quad (1.1)$$

where L is a Laplace transformation operator and $f(s)$ denotes the Laplace transform of $F(t)$. s (in general complex number) is called as Laplace transform parameter

Note: The Laplace transform of $F(t)$ is said to exist if the improper integral (1.1) converges for some value of s , otherwise it does not exist.

Laplace
Transform

Properties of
Laplace
transform

Laplace
transform of
 $\{tF(t)\}$ and
 $\left\{\frac{F(t)}{t}\right\}$

Laplace
transform of
 $\operatorname{erf}(\sqrt{t})$

Examples

Exercise

Example 3:

Find the Laplace transform of $F(t) = t^n$, n is any real number greater than -1 .

Sol: By definition, we have

$$L\{F(t)\} = \int_0^{\infty} e^{-st} (t^n) dt = \int_0^{\infty} e^{-st} t^{(n+1)-1} dt \quad (1.2)$$

From the properties of Gamma function, we know that

$$\int_0^{\infty} e^{-ax} x^{m-1} dx = \frac{\Gamma(m)}{a^m}, \quad a > 0, m > 0 \quad (1.3)$$

Replacing a by s , m by $(n+1)$, and x by t in (1.3), we have

$$\int_0^{\infty} e^{-st} t^{(n+1)-1} dt = \frac{\Gamma(n+1)}{s^{n+1}}, \quad s > 0, n+1 > 0$$

$$\Rightarrow L\{t^n\} = \frac{\Gamma(n+1)}{s^{n+1}}, \quad s > 0, n > -1$$

Existence of Laplace transform

Mathematical
Methods(MA-
203)

Prof. S.
Mukhopadhyay

Laplace
Transform

Properties of
Laplace
transform

Laplace
transform of
 $\{ tF(t) \}$ and
 $\left\{ \frac{F(t)}{t} \right\}$

Laplace
transform of
 $\operatorname{erf}(\sqrt{t})$

Examples

Exercise

Existence of $L\{F(t)\}$ depends of two properties of $F(t)$:

- $F(t)$ is **piecewise continuous**, which means, it must be single valued but can have a finite number of finite isolated discontinuities for $t > 0$.
- and $F(t)$ is of **exponential order**.

Sufficient conditions for the existence of Laplace transform

Mathematical
Methods(MA-
203)

Prof. S.
Mukhopadhyay

Laplace
Transform

Properties of
Laplace
transform

Laplace
transform of
 $\{tF(t)\}$ and
 $\left\{\frac{F(t)}{t}\right\}$

Laplace
transform of
 $\text{erf}(\sqrt{t})$

Examples

Exercise

Theorem:

If $F(t)$ is of some exponential order as $t \rightarrow \infty$ and is piecewise continuous over every finite interval of $t \geq 0$, then Laplace of $F(t)$ exists.

OR

If $F(t)$ is piecewise continuous over every finite interval of $t \geq 0$ and satisfies $|F(t)| < me^{\sigma t}$ for all $t \geq 0$ (σ and m are constants), then $L\{F(t)\}$ exists.

Proof: Since $F(t)$ is of exponential order, say σ , then we have

$$|F(t)| < me^{\sigma t} \quad \text{for } t \geq t_0 \quad (1.4)$$

where σ is a positive constant and $m > 0$, $t_0 > 0$. Now

$$\begin{aligned} L\{F(t)\} &= \int_0^{\infty} e^{-st} F(t) dt \\ &= \int_0^{t_0} e^{-st} F(t) dt + \int_{t_0}^{\infty} e^{-st} F(t) dt = I_1 + I_2 \end{aligned} \quad (1.5)$$

Proof contd....

Mathematical
Methods(MA-
203)

Prof. S.
Mukhopadhyay

Laplace
Transform

Properties of
Laplace
transform

Laplace
transform of
 $\{tF(t)\}$ and
 $\left\{\frac{F(t)}{t}\right\}$

Laplace
transform of
 $\operatorname{erf}(\sqrt{t})$

Examples

Exercise

Since $F(t)$ is piecewise continuous on every finite interval $0 \leq t \leq t_0$, therefore I_1 exists. Again

$$|I_2| = \left| \int_{t_0}^{\infty} e^{-st} F(t) dt \right| \leq \int_{t_0}^{\infty} e^{-st} |F(t)| dt < m \int_{t_0}^{\infty} e^{-st} e^{\sigma t} dt, \text{ using (1.4)}$$

Thus,

$$|I_2| < m \left[-\frac{e^{-(s-\sigma)t}}{(s-\sigma)} \right]_{t_0}^{\infty} = \frac{me^{-(s-\sigma)t_0}}{s-\sigma} \quad (1.6)$$

Now, when $s > \sigma$, then $e^{-(s-\sigma)t_0} \rightarrow 0$ as $t \rightarrow \infty$. Hence, (1.6) shows that $|I_2|$ is finite for all $t_0 > 0$ when $s > \sigma$ and hence, I_2 is also convergent. Then from (1.5), it follows that $L\{F(t)\}$ exists for all $s > \sigma$.

Note: The conditions stated in the above theorem are sufficient to ensure the existence of Laplace transform of $F(t)$. These are not necessary conditions for the existence of $L\{F(t)\}$.

Counter example

Mathematical

Laplace
Transform

Properties of
Laplace
transform

Laplace
transform of
 $\{tF(t)\}$ and
 $\left\{\frac{F(t)}{t}\right\}$

Laplace
transform of
 $\operatorname{erf}(\sqrt{t})$

Examples

Exercise

Counter Example:

Consider the function $F(t) = 1/\sqrt{t}$.

The function $F(t)$ is not piecewise continuous on every finite interval in the range $t \geq 0$ as $t \rightarrow 0$, $F(t) \rightarrow \infty$.

Now, taking Laplace transform of $F(t)$, we have

$$\begin{aligned} L\{F(t)\} &= \int_0^{\infty} e^{-st} (1/\sqrt{t}) dt = \frac{2}{\sqrt{s}} \int_0^{\infty} e^{-x^2} dx \\ &= \frac{2}{\sqrt{s}} \cdot \frac{\sqrt{\pi}}{2}, \quad s > 0 \end{aligned}$$

Hence, $L\{F(t)\}$ exists for $s > 0$ even if limit $F(t)$ does not exist at $t = 0$.

Note: $\int_0^{\infty} e^{-x^2} dx = \frac{\sqrt{\pi}}{2}$.

 $\left\{\frac{F(t)}{t}\right\}$

Laplace
transform of
 $\operatorname{erf}(\sqrt{t})$

Examples

Exercise

The “error function” is defined as

$$\operatorname{erf}(t) = \frac{2}{\sqrt{\pi}} \int_0^t e^{-u^2} du$$

and the “complement of error function” is defined as

$$\operatorname{erfc}(t) = 1 - \operatorname{erf}(t) = \frac{2}{\sqrt{\pi}} \int_t^{\infty} e^{-u^2} du$$

Now,

$$L\left\{\operatorname{erf}(\sqrt{t})\right\} = \frac{1}{s\sqrt{s+1}}$$

Laplace transform of $\operatorname{erf}(\sqrt{t})$ contd...

Proof:

We have, $\operatorname{erf}(t) = \frac{2}{\sqrt{\pi}} \int_0^t e^{-u^2} du$, therefore by definition

$$\begin{aligned}\operatorname{erf}(\sqrt{t}) &= \frac{2}{\sqrt{\pi}} \int_0^{\sqrt{t}} e^{-u^2} du = \frac{2}{\sqrt{\pi}} \int_0^{\sqrt{t}} \left(1 - u^2 + \frac{u^4}{2!} - \frac{u^6}{3!} + \dots\right) du \\&= \frac{2}{\sqrt{\pi}} \left[u - \frac{u^3}{3} + \frac{u^5}{5 \cdot 2!} - \frac{u^7}{7 \cdot 3!} + \dots \right]_0^{\sqrt{t}} \\&= \frac{2}{\sqrt{\pi}} \left[t^{1/2} - \frac{t^{3/2}}{3} + \frac{t^{5/2}}{5 \cdot 2!} - \frac{t^{7/2}}{7 \cdot 3!} + \dots \right]\end{aligned}$$

Now,

$$\begin{aligned}L\{\operatorname{erf}(\sqrt{t})\} &= \frac{2}{\sqrt{\pi}} \left\{ \frac{\Gamma(3/2)}{s^{3/2}} - \frac{\Gamma(5/2)}{3s^{5/2}} + \frac{\Gamma(7/2)}{5(2!s^{7/2})} - \frac{\Gamma(9/2)}{7(3!s^{9/2})} + \dots \right\} \\&= \frac{1}{s^{3/2}} \left\{ 1 - \frac{1}{2} \cdot \frac{1}{s} + \frac{1 \cdot 3}{2 \cdot 4} \frac{1}{s^2} - \frac{1 \cdot 3 \cdot 5}{2 \cdot 4 \cdot 6} \frac{1}{s^3} + \dots \right\} \\&= \frac{1}{s^{3/2}} \left(1 + \frac{1}{s} \right)^{-1/2} = \frac{1}{s\sqrt{s+1}}\end{aligned}$$

Examples

Exercise

Example 1:

Find the Laplace transform of $f(x) = \begin{cases} x/a & , 0 < x < a \\ 1 & , x > a \end{cases}$.

Sol: By definition, we have

$$\begin{aligned} L\{f(x)\} &= \int_0^{\infty} e^{-sx} f(x) dx \\ &= \int_0^a e^{-sx} f(x) dx + \int_a^{\infty} e^{-sx} f(x) dx \\ &= \int_0^a e^{-sx} \left(\frac{x}{a}\right) dx + \int_a^{\infty} e^{-sx} (1) dx \\ &= \left[\left(\frac{x}{a}\right) \left(-\frac{e^{-sx}}{s}\right) - \left(\frac{1}{a}\right) \left(-\frac{e^{-sx}}{s^2}\right) \right]_0^a + \left[-\frac{e^{-sx}}{s} \right]_a^{\infty}, s > 0 \\ &= \frac{(1 - e^{-sa})}{as^2}, s > 0 \end{aligned}$$

Example 2:

$$\text{Show that } L\left\{\sin(\sqrt{t})\right\} = \frac{\sqrt{\pi}}{2} \frac{e^{-1/4s}}{s^{3/2}}.$$

Sol. We have

$$\begin{aligned}\sin(\sqrt{t}) &= \sqrt{t} - \frac{(\sqrt{t})^3}{3!} + \frac{(\sqrt{t})^5}{5!} - \frac{(\sqrt{t})^7}{7!} + \dots = t^{1/2} - \frac{t^{3/2}}{3!} + \frac{t^{5/2}}{5!} - \frac{t^{7/2}}{7!} + \dots \\ \Rightarrow L\left\{\sin(\sqrt{t})\right\} &= L\left\{t^{1/2}\right\} - \frac{1}{3!}L\left\{t^{3/2}\right\} + \frac{1}{5!}L\left\{t^{5/2}\right\} - \frac{1}{7!}L\left\{t^{7/2}\right\} + \dots \\ &= \frac{\Gamma(3/2)}{s^{3/2}} - \frac{\Gamma(5/2)}{3!s^{5/2}} + \frac{\Gamma(7/2)}{5!s^{7/2}} - \frac{\Gamma(9/2)}{7!s^{9/2}} + \dots \\ &= \frac{\frac{1}{2}\sqrt{\pi}}{s^{3/2}} - \frac{1}{6} \frac{\frac{3}{2} \cdot \frac{1}{2} \cdot \sqrt{\pi}}{s^{5/2}} + \frac{1}{120} \frac{\frac{5}{2} \cdot \frac{3}{2} \cdot \frac{1}{2} \cdot \sqrt{\pi}}{s^{7/2}} - \dots \\ &= \frac{\sqrt{\pi}}{2s^{3/2}} \left\{ 1 - \left(\frac{1}{4s}\right) + \frac{1}{2!} \left(\frac{1}{4s}\right)^2 - \frac{1}{3!} \left(\frac{1}{4s}\right)^3 + \dots \right\} \\ &= \frac{\sqrt{\pi}}{2} \frac{e^{-1/4s}}{s^{3/2}}\end{aligned}$$

Example 3:

Evaluate $L\left\{\frac{e^{-at}t^{n-1}}{(n-1)!}\right\}$.

Sol: By definition of Laplace transform, we have

$$\begin{aligned}L\left\{\frac{t^{n-1}}{(n-1)!}\right\} &= \frac{1}{(n-1)!} L\{t^{n-1}\} \\&= \frac{1}{(n-1)!} \cdot \frac{\Gamma n}{s^n} = \frac{1}{(n-1)!} \cdot \frac{(n-1)!}{s^n} \\&= \frac{1}{s^n} = f(s)\end{aligned}$$

Hence, by first shifting theorem, we get

$$L\left\{\frac{e^{-at}t^{n-1}}{(n-1)!}\right\} = f(s+a) = \frac{1}{(s+a)^n}$$
